IDENTIFICATION OF 12 STD PATHOGENS IN SEMEN USING POLYMERASE CHAIN REACTION (PCR) AND "FLOW-THROUGH" HYBRIDIZATION TECHNOLOGY

Rubina Ghani, Professor
Department of Biochemistry,
Baqai Medical University
Pathological & Molecular Laboratories, Karachi, Pakistan
Sexually transmitted diseases (STDs)

- Sexually transmitted diseases (STDs) are caused by several pathogens, including bacteria, viruses and protozoa, and can induce male infertility through multiple pathophysiological mechanisms.
- Sexually transmitted infections (STI)
- Illnesses that have a significant probability of transmission between humans by means of sexual behavior
  - vaginal intercourse
  - anal sex
  - oral sex
19 million new cases of sexually transmitted infections every year in the United States.¹

In 2005, the World Health Organization estimated that 448 million people aged 15–49 were being infected a year with curable STIs (such as syphilis, gonorrhea and chlamydia).²

There were an estimated 34 million people living with human immunodeficiency virus (HIV) in 2010.³

High prevalence of sexual transmitted infections around the globe \(^1\)

STDs can be bacterial, viral and parasitic

- **Bacterial**
  - *Neisseria gonorrhoeae* (NG)
  - *Mycoplasma genitalium* (MG)
  - *Ureaplasma parvum* (UP)
  - *Mycoplasma hominis* (MH)
  - *Chlamydia trachomatis* (CT)
  - *Ureaplasma urealyticum* (UU)

- **Viral**
  - *Herpes Simples Virus 1 / 2* (HSV 1, HSV 2)
  - *Human Papillomavirus 6 / 11* (HPV 6, HPV 11)

- **Parasitic**
  - *Trichomonas vaginalis* (TV)
STDs can lead to serious outcomes

- Mother to child transmission route is possible.¹
- Emerging trend of drug resistant NG. ²
- STDs are associated with HIV infection ³

Reasons to genotype STD pathogens

- Many STDs are asymptomatic
- Different STDs have overlapping symptoms
- Different STDs have different treatments
- Co-infection rate is unexpectedly high
Most STD are asymptomatic

• ~85% of women have asymptomatic CT infection
• HPV is the most common asymptomatic STD among younger patients
• Asymptomatic infection of NG accounts for around 10% in men and 50% in women

Different STDs share common symptoms

STD co-infection: more than you expect

MG: 30.4% with NG
• MH: 3.4% with UU
• UU/UP: High UU-MH co-infection pattern (13.91%)
• HPV: HSV and CT are associated with HPV infections

STD co-infection: more than you expect

- **TV**: 5-13% with MG\(^1\)
- • **HSV 1&2**: 1.4% with CT/NG\(^2\)
- • **CT**: Among MG positive samples, 25% with CT co-infection\(^3\)
- • **NG**: Among MG positive samples, 73.3% of female with NG co-infection\(^4\)

---

HOST FACTORS

• **AGE:** Highest rate are prevalent in 20-24 years old & followed by 25-29 & 15-19 years age groups.

• **GENDER:** Morbidity is higher in men.

• **MARITAL STATUS:** Higher among single, divorced and separated persons than among married couples.
DEMOGRAPHIC FACTORS

Certain demographic factors contribute to a higher prevalence rates. They are;

2. Rural to Urban migration.
3. Increasing educational opportunities for women.
4. Delayed marriage due to the afore said.
SOCIAL FACTORS

1. Prostitution (good time girl).
2. Broken homes.
4. Easy money.
5. Emotional immaturity.
6. Urbanization.
10. Alcoholism.
OBJECTIVE
Identify the cause of infertility in Male.

- To access in health care facilities for diagnosis and common pathogens of STDs,

- Those causing infertility and see the cause of Chlamydia trachomatis, Neisseria gonorrhoeae, human papillomavirus (HPV) and Mycoplasma hominis transferred in female.

- Genital wart is a highly contagious sexually transmitted disease caused by some sub-types of human papillomavirus (HPV).
Causes of Infertility
Causes of Male Infertility

- It affects approximately 7% of all men.
- Male infertility is commonly due to deficiencies in the semen, and semen quality is used as a surrogate measure of male fertility.
- One third of fertility problems occur solely in women.
- One third in men

The remaining third are mutual.
Sperm Abnormalities

Major sexually transmitted disease pathogens detected in semen

- **Bacteria**
  - Chlamydia trachomatis
  - Neisseria gonorrhoeae
  - Mycoplasma spp.
  - Ureaplasma spp.
  - Treponema pallidum

- **Viruses**
  - Human papillomavirus
  - HIV-1
  - Herpes simplex virus
  - Hepatitis B virus
  - Hepatitis C virus
  - Human cytomegalovirus

- **Protozoa**
  - Trichomonas vaginalis

Risk factors for male infertility include:

- Aging, which can reduce sperm counts and motility and decrease the genetic quality of sperm
- Sexually transmitted diseases, which can cause scarring in the male reproductive system or impair sperm function
- Lifestyle factors such as smoking and substance abuse
- Long-term or intensive exposure to certain types of chemicals, toxins, or medications
DNA damage

- Common inherited variants in genes that encode enzymes employed in DNA mismatch repair are associated with increased risk of sperm DNA damage and male infertility

Others Causes

- Environmental toxins such as chemicals
- Radiation
- Pollution
- Drugs/ Street drug use
- Stress
- Cigarette smoking
- Frequent sex/ Lifestyle habits
- Heavy metal exposure/ Poor diet
- Overuse of alcohol

The uniqueness of "Flow-through" hybridization is by directing the amplicons toward the DNA probes to form duplexes.

The "Flow-through" hybridization is changing from traditional passive to active channeling process allowing the recombination reactions to complete in seconds.

DNA hybridization assays are known to have excellent signal-to-noise ratio.

It enables unambiguous detection of multiple pathogens/disease genotypes in one single reaction.

Higher infection rate of CT and NG in positive sample

• CT and NG infection: most important STD screening parameters

• NG infection: asymptomatic or often mistaken as virginal or bladder infection\(^1\). May progress to serious complications as skin pustules or petechial, septic arthritis, meningitis, or endocarditis\(^2\).

• ~85% of women have asymptomatic CT infection\(^3\)

---

\(^1\)http://www.cdc.gov/STD/gonorrhea/stdfact-gonorrhea.htm

CT/HPV co-infection may worsen the clinical outcomes

- Co-infection may prolong both pathogen’s infection, and increasing the risk of cervical cancer or infertility\(^1\)
- CT/HPV co-infection may delay HPV lesion clearance\(^2,3\)
- **Monitoring and control of both pathogens are necessary**
- **The co-infection effects of other STD pathogens are also concerned**

Conclusion
STD screening and treatment should be a primary intervention and a standard of care in all health care settings.

Screening for bacterial STI pathogens, *Mycoplasma hominis*, *Chlamydia trachomatis* and *Neisseria gonorrhoeae* are strongly recommended because these pathogens can cause serious reproductive complications such as pelvic inflammatory disease, ectopic pregnancy.

Studies show STD and HIV co-infection increases HIV virus shedding in the patients’ genital secretions.
• **STD infection** rates are common around the globe
• HPV/STD co-infection may **worsen the clinical outcome**
• **Close monitoring** of both HPV and STD infection is necessary
• Cost effect technology should be used
THANK YOU
